

Document Name:	0102b048
Section:	TAPPI PRESS
Title:	Wood Quality Factors in Loblolly Pine

TAPPI PRESS

Wood Quality Factors in Loblolly Pine
Edited by R. A. Megraw

1985. 88 pp., 6-1/2" x 9-1/2" hard cover
Item Number: 0102B048

ISBN: 0898520487

Table of Contents

1 Specific Gravity

Clarification of terminology
Precision perspective
Fundamentals of specific gravity variation
Within-ring specific gravity variation
Within-tree specific gravity variation
 Cross-sectional variation
 Earlywood-latewood contributions
Between tree variability
Heritability
Effect of growth rate on specific gravity
Effect of diameter on end product specific gravity
Effect of site index on specific gravity
Effect of geographic location on specific gravity
Summary of major points on specific gravity

2 Fiber Length

Clarification of terminology
Factors controlling fiber length
Within-tree variation in fiber length
Earlywood vs. latewood tracheid length
Significance of within-tree variation in fiber length
Summary of major points on fiber length

3 Fibril Angle

Primary factors influencing fibril angle
Within-tree variation in fibril angle
Relation of fibril angle to strength properties
Relation of fibril angle to shrinkage
Significance of fibril angle variation
Summary of major points on fibril angle

4 Effect of Cultural Practices: Thinning, Fertilization, and Pruning

Thinning effects on specific gravity
Thinning effects on other properties: fiber

length, compression wood, and straightness
Fiber length
Compression wood
Straightness
Fertilization effects on specific gravity
Fertilization effects on fiber length
Effects of pruning on specific gravity
Summary of cultural treatment effects
Thinning
Fertilization
Pruning

Bibliography

Subject Index

anticlinal division;
 fiber length of, effect of diameter growth, elongation of
auxins;
 influence of, translocation of

basic density
between tree variation
butt swell

cambial cell;
 anticlinal division, periclinal division, psuedo-transverse division
cell division;
 rate of
cell lumens
cell wall;
 substance of, earlywood, latewood, thickness
cross-sectional variation

crown wood;
in young trees

density

false rings

fiber

fiber length;

affected by growth rate, cambial initial, controlling factors, effect of fertilization, impact on paper properties, increase in, influence of butt swell, influence of growth rate, internode length, relationship to fiber angle, within-tree variation, significance of

fiber tracheids

fibril angle;

butt logs, influence on, influence of tracheid length, longitudinal shrinkage, measurement of, modulus of elasticity, modulus of rupture, patterns of, relationship to fiber length, relation to shrinkage, theoretical equation

for, relation to paper strength, specific gravity

relationship, tracheid length, within-tree variation

fibril angle variation;
significance of

green volume

heartwood

heritability;

broad-sense, narrow-sense

juvenile wood

latewood percentage;
variation in

libriform fibers

microfibrils;

influence of

moisture content;

determination of

new needle maturity

nitrogen fertilization

overcrowding;

effects on specific gravity

periclinal cambial division

phloem

photosynthate;

translocation of

photosynthesis

principle of archimedes

ray cells

root wood;
transition to

site;

variation of

site index;

by dominant trees, effect on percentage corewood, effect on specific gravity, rising values

specific gravity;

base of the tree, between-tree genetic variation, characteristics, diameter, effect on end product, earlywood contributions, effect of fertilization, duration of influence, cell production, frequency of doses, on crown, on tracheid diameter, on wall thickness, effect of geographic location, effect of pruning, on crown, effect of site index, end product, environmental factors, function of biological age, genetic control, green volume, growth rate, effect on density, heritability, narrow-sense, traits, influence, latewood contributions, lower bole, oven-dry weight, ring position, values, error control, variation, crown, physiologic, within-ring, within-tree, versus fiber length, versus fibril angle, volume basis, volume-oven-dry weight basis, weight basis

stocking density

thinning effects on;

compression wood, fiber length, specific gravity, straightness

tracheid;

cambial initial, length, earlywood, influenced by internode, latewood

vascular cambium

water displacement

water molecules

within-ring specific gravity;

evaluation of

within-tree;

fiber length variation, pattern in

wood density;

measure of

wood;

extractives, produced by, rehydration of, substance of

xylem

young trees
